Western Canada's Pavilion At Expo '67 Features Series Of "Experience Capsules"

A LINKED SERIES OF "experience capsules" portrays to visitors to the Western Canada Pavilion at Expo '67 in Montreal, some of the major resources of western Canada, in a manner that will leave them indelibly imprinted on their minds. Ten of these unique display units are contained in the strikingly different Western Canada Pavilion, sponsored jointly by British Columbia, Alberta, Saskatchewan and Manitoba.

The 12,000-square-foot Pavilion stands out among the highly modernistic designs of other national and international pavilions. In profile, the structure portrays the geographic nature of the west, with the flat prairies rising through the foothills to a peak at the tree-clad Rockies, and tapering off abruptly to the coast. Some 40 feet high at the apex of the oval roof opening, the structure is topped again by 20 to 30 feet by the tips of trees growing through that opening.

The entire structure is clad in cedar shingles. There are no walls. The roof structure rests just above slightly elevated earthen ramparts and at night, when interior lights are on, appears to float gently above the ground.

All possible senses of visitors are utilized in bringing sharply to their attention some of western Canada's resources, as portrayed in the "experience capsules". Heat and cold, smells, vibrations, sounds, colors, movement, visual distortions, 'atmosphere' in surroundings — all are utilized to impart to the visitor a strong impression of being actually present in a field or resource or resource development peculiar to the west. Such areas as mining, agriculture, forest products, research, manufacturing, potash, fishing, energy, forestry, and others are on display.

There are no political divisions in the western presentations. The Western Canada Pavilion

This is the Western Canada Pavilion at Expo '67. For a glimpse of what's inside, see the pictures on Pages 4 and 5.

treats of resource developments that are found in the whole area from the eastern Manitoba border to the western shore of British Columbia.

The Western Canada Pavilion project is sustained by an overall budget of \$1,350,000. This covers cost of design, construction, operation and administration, and demolition.

The Western Canada Pavilion is administered by a four-man working committee. Commissioner General of the Pavilion is Mr. C. A. Hooey, of the Manitoba Department of Trade and Industry;

Saskatchewan is represented by the Hon. Wilf Gardner, Minister of Public Works; Alberta representative and publicity director for the pavilion is Hal Martin, Director of Publicity and Advertising for the Government of Alberta; and British Columbia representative is L. J. Wallace, Deputy Provincial Secretary.

An unusual aspect of the Western Canada Pavilion is the use of metal sculpture at various points throughout the grounds and interior. Calgary's Roy Leadbeater, of national renown, was commissioned to undertake construction of a kinetic sculpture for the display.

New Clinical Sciences Building Is First Phase Of Vast Health Centre Complex At University

CONSTRUCTION OF THE NEW Clinical Sciences Building at the University of Alberta started in May, on a contract for \$6,953,000.

The Clinical Sciences Building is Phase I of the vast University of Alberta Health Sciences Centre, which is to be built over the next 10 years, at a cost estimated to exceed \$100,000,000.

The Centre will be one of the world's most advanced medical complexes. When its ten buildings are completed and in operation, it will provide a range and quality of facilities not available anywhere else in the world.

The Clinical Sciences Building will provide faculty offices, laboratories and teaching facilities for the clinical department of the Faculty of Medicine. These include the departments of medicine, surgery, obstetrics and gynaecology, pediatrics, psychiatry, community medicine and radiology. Space also will be provided for the department of Continuing Medical Education and Graduate Education, for the department of Research in Medical Education and for the Medical Laboratory Science Program.

These departments have been contained in space made available by the University Hospital, and additional facilities have been used in various Edmonton hospitals.

The Clinical Sciences Building will be built immediately southwest of the present University Hospital, and will be connected to it so existing facilities can continue to be used. The building will consist of a two-storey base, plus a basement and sub-basement, and an eleven-storey tower plus penthouse. There will be connections to the existing hospital at the second floor and basement levels.

The exterior finish will consist of pre-cast concrete panels, with fixed, sealed double-glazed windows in aluminum frames. The tower columns will be clad in stainless steel.

Next buildings to be constructed in the Health Sciences Complex will be the Centennial Hospital, immediately west of the existing hospital, and a Basic Medical Sciences Building at the northwest corner of the site, south of the

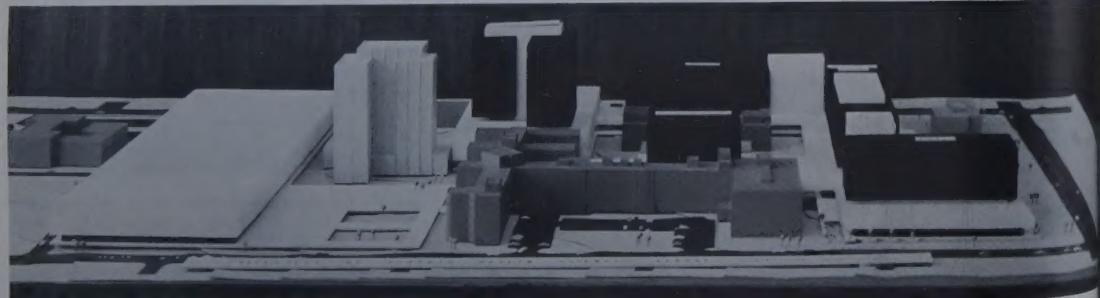

Clinical Sciences Building At U. of A.

Alberta Research Council building. The Central Services and Common Facilities building will be the next unit constructed.

The Centennial Hospital will be about twice the size of the present University Hospital

but will have less than half the number of beds. It will contain facilities for open heart surgery, brain surgery, plastic surgery, artificial kidney unit and investigative centres for cases hard to diagnose.

Coroners Attend Education Course

SEVENTY CORONERS FROM all parts of Alberta met in Edmonton in May for a two-day seminar on alcohol problems and the function and operation of a Breathalyzer machine, which indicates the degree of intoxication. This was followed by a three-day session of the Coroners' Continuing Education Course.

The Breathalyzer seminar was designed to familiarize the coroners with the machine, its use, and the training of operators. The knowledge gained will assist the medical men in presenting expert testimony in courts when called upon to do so.

The Continuing Education Course included a detailed study and discussion of the Coroners' Act, studies of industrial and motor vehicle fatalities, violent deaths, homicides and child battery. Talks were heard on evidence and the expert witness, on hallucinatory drugs, and on common law as it pertains to coroners. Sessions on coroners' problems were conducted by Dr. M. M. Cantor, provincial chief coroner for Alberta, who was in charge of the seminar and education course.

Alberta's Provincial Parks Division has adopted a new symbol to be used on all park entrance signs, equipment and buildings. As an embroidered shoulder patch, it will be worn by park staff on their uniforms. Multi-colored, the symbol depicts the great outdoors — clear sky, sun, water, trees and the seeds of new growth. The circle represents the life cycle.

New Provincial Park

A NEW PROVINCIAL PARK will be established on the north shore of Moose Lake, near Bonnyville, with a 17,190 acre location approved by Order-in-Council.

Physical development of Moose Lake Provincial Park will not take place this season, according to E. P. Shaver, Director of the Provincial Parks Division. First there will be an on-the-ground assessment of the area, to plan roads, camp and picnic areas and boat launching sites.

The site was selected after careful study as having good potential to serve a large area of growing population in east-central Alberta. Moose Lake is about eight miles long and four miles wide, of very irregular shape.

Much of the work in the provincial parks system in 1967 will be assessment of the newly established parks with some priority being given to three parks, Sir Winston Churchill, on an island in Lac la Biche, Jarvis Bay on Sylvan Lake and another new park of 313 acres on the west side of Pigeon Lake. The park on Pigeon Lake is expected to provide camping facilities for both tents and trailers. These facilities are not available at the small Ma-Me-O Beach park at the south end of the lake.

Operation of Breathalyzer equipment was described to Alberta coroners at a seminar held in Edmonton in May. An explanation of the working of the machine was given by Detective Staff Sergeant Stanley L. Stevens, centre, who is in charge of the Identification Section of the Edmonton City Police. Inspecting the machine are Dr. R. R. Cherry, Devon; Dr. M. M. Cantor, Chief Coroner for Alberta; Dr. D. S. White, Wainwright; and Dr. J. E. McTavish, Lethbridge.

Brochure Outlines Estate Tax Rebate Act

A COMPLIMENTARY BROCHURE containing the text of the Estate Tax Rebate Act, regulations and forms, with explanatory notes outlining the policies and procedures of Alberta's new legislative program, is available upon written request to the Administrator, Estate Tax Rebate Office, Room C401, Terrace Buildings, Edmonton.

The Estate Tax Rebate Act came into force April 1, 1967 and makes provision for the return to the estate of deceased persons who were bona fide residents of Alberta, of the entire portion of the provincial share of the federal estate tax. For Alberta, "basic estate tax" payment by the federal government to the province is 75% of

the federal tax attributable to property situated in Alberta, and where the deceased died domiciled in Alberta, property other than real property, situated outside Canada passing to persons domiciled or resident in Alberta.

Persons wishing to take advantage of the new Act should obtain suitable advice determining such matters as the difference between domicile in Alberta and residence in Alberta; establishment of eligibility of property having situs in Alberta. Federal "situs" rules and other similar matters are referred to in the federal government "Estate Tax Guide" available at district taxation offices.

Relief Map Shows Highs And Lows

A RELIEF MODEL of the Province of Alberta measuring approximately 5 by 8 feet has been prepared by the Mapping Division of the Surveys Branch, Alberta Department of Highways. The relief span represented on the model ranges from a 573-foot low point in the province (Slave River at the Alberta-Northwest Territory boundary) to the 12,294 feet of Mount Columbia on the Alberta-British Columbia boundary halfway between Banff and Jasper.

The model has been carved in balsa wood at a horizontal scale of 8 miles to the inch, or 1:506,880. The vertical scale has been exaggerated from twenty times the horizontal scale in the lowland areas to five times in the mountain areas, to give as realistic a representation as possible of Alberta's characteristics.

A master mold was made from the balsa wood original from which fiberglass casts will be reproduced. An initial order of 20 such casts will be used to depict various historical, geological, exploratory and commercial aspects of the province. Models will be coloured to show vegetation, hydrography and principal highways. Cities and towns will be labelled.

The relief models will be made available to the public but it is anticipated that the \$1,000 cost of the finished product will limit purchases to those groups or organizations who can tangibly benefit from the possession of such a reproduction.

Enquiries should be directed to the Director of Surveys, Department of Highways, Highways Building, Edmonton.

Balsa Wood Original

"Within Our Borders" is a publication designed to acquaint the people of the Province with the administration of the Alberta Government.

There are no restrictions in the republishing of any material but a credit line would be appreciated.

Notice of change of address should be accompanied by the mailing address on the front of this issue. No charge is made for "Within Our Borders" and new readers are invited to forward their name and address to "Within Our Borders," Room 245, Highways Building, Edmonton.

AUTHORIZED AS SECOND CLASS MAIL, POST OFFICE DEPARTMENT, OTTAWA AND FOR PAYMENT OF POSTAGE IN CASH.

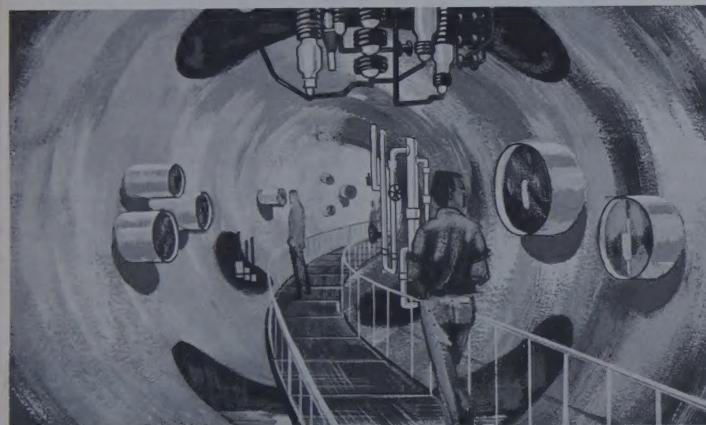

Capsules Allow Visitors In Western Canada Pavilion

Pavilion visitors find themselves in a realistic western farm scene as they progress through the agricultural display capsule toward the livestock section.

Products of Western Canada forests are prominently displayed in this animated exhibit.

Energy moves by tube, and the energy capsule conforms to this shape as it displays impressions of the tremendous energy resources of the western provinces.

The immense logging truck is an outstanding feature of the exhibit.

The realistic fishing shed, and the writhing netful of fresh fish dripping from the side of the fishing boat, testify to the importance of the fresh and salt water fishing industry in the west.

The way of life of Western Canada's people is dramatically presented in this theatre.

To Experience Full Range Of Sights And Sounds

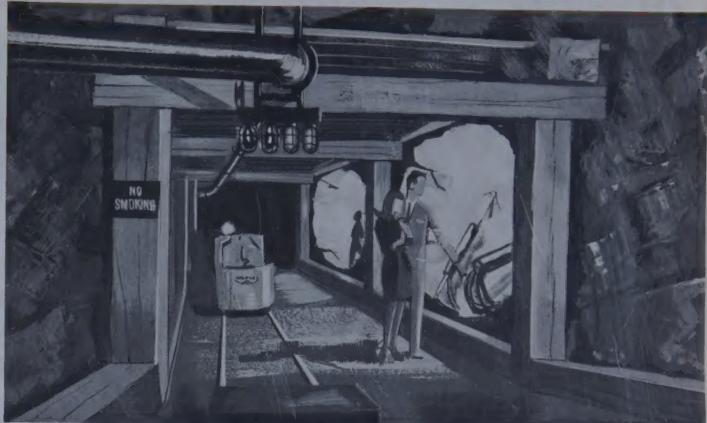

...woods to pulp and from paper to timber, impress-

...ente of attraction in the forest scene, as

...ce, its people, is presented in a three-screen

The mine, with its rocky walls imbedded with representative samples of the west's many kinds of mineral riches, depicts Western Canada's underground wealth.

The wholesome odors of processing food and the glitter of moving cans enrich the atmosphere of the food processing section.

Research and development, by private industry and by government, has played an important role in the growth of western industry.

Fibreglass Cupolas Form Weatherproof Shelters On Top Of Alberta's 140 Forestry Towers

A N EXPERIMENT STARTED 12 years ago in the use of fibreglass to make cupolas for Alberta Forest Service lookout towers has resulted in the installation of these light-weight, durable structures on almost all of the 140 lookouts now in service in the province's forested areas.

Construction of the octagonal cupolas has become a routine operation at the forest service shops in Edmonton. Eight panels, each forming a roof and wall section, are molded for each cupola. Glass windows in aluminum frames are installed, connecting flanges are drilled for bolt holes, and the panels are assembled in the shop to assure a perfect fit. Then they are taken apart and packaged for transportation to a tower site.

Many cupolas are taken to isolated tower areas by helicopter, so light weight and ease of handling are important. The eight panels are strapped together in pairs, roof cap and floor boards, bolts and other hardware, and lightning rod assemblies are packaged to complete a shipment. The total weight is about 650 pounds for a structure eight feet in diameter, which is perched 50 to 100 feet above ground on a steel tower to give a lookout man unobstructed view of his territory for miles around.

The unit is only about half the weight of the wooden structures used previously, little maintenance is required, and they are practically indestructible. The strength of the guyed steel towers, topped with the tensile strength of 15,000 pounds per square inch of the fibreglass walls, has been demonstrated by the fact that none has been damaged by storms or hurricane-force winds of up to 120 m.p.h.

As the lookout towers always rise in the air to become the highest point for miles around, they are natural targets for lightning strikes. As a result, efficient protection is provided with each installation. Two thick copper lightning rods on the roof are grounded by heavy woven copper cable to a grid network buried in the ground, the extent of the grounding grid being determined by the conductivity of the soil.

Protected or not, a cubicle high in the air when lightning is flashing around is not a safe place to be, so standard procedure is for lookout men to evacuate the tower during the height of an electrical storm, and to return as soon as the danger has passed.

Construction of each cupola takes about 80 man-hours, complete to painting, alternate panels being white and international orange. Because of the hardening time required after the fibreglass cloth, resin and catalyst have been applied

Fibreglass cupola for forestry lookout tower is assembled in Edmonton shops of Alberta Forest Service, before being packaged to ship out. Looking through a "fire finder" telescope is Peter Kisling, fibreglass technician, who molds the panels.

in the mold, only one panel per day is produced normally. During the winter 11 complete cupolas were made.

Added benefits from the shop's fibreglass operation have accrued over the years, with experimentation in many fields. Fibreglass calipers for measuring the diameter of trees by forest officers have proven most successful, eliminating the high breakage rate experienced with wooden calipers previously used. Fibreglass axe handles

and load-carrying toboggans have been produced experimentally, and the shop has produced and repaired many panels and housings for forestry airplanes.

Of most practical use has been the shop's experience in building fibreglass "workhorse" boats for the department. Sixteen and eighteen-foot models are built, and fitted with outboard motors, inboard-outboard units or jet propulsion units.
